

<b>DeMorgan’s Laws:</b> <div> <ul style="list-style-type: none"> <li><math>\overline{A \cap B} = \overline{A} \cup \overline{B}</math></li> <li><math>\overline{A \cup B} = \overline{A} \cap \overline{B}</math></li> </ul> </div>
<b>Countable</b> if elements can be put in one-to-one with $\mathbb{N} = \{1, 2, 3, \dots\}$
<b>Uncountable sets:</b> <div> <ul style="list-style-type: none"> <li><math>\mathbb{R} = (-\infty, \infty)</math></li> <li><math>[0, 1]</math> and <math>(0, 1)</math></li> <li><math>(a, b), \forall a, b \in \mathbb{R}</math> such that <math>a &lt; b</math></li> </ul> </div>

A family of sets  $\{\mathcal{A}_i, i \in I\}$  is a **partition of  $\mathcal{S}$**  if it is disjoint and collectively exhaustive over  $\mathcal{S}$ .

#### Axioms of Probability

- $\mathcal{P}(A) \geq 0, \forall A \in \mathcal{F}(\mathcal{S})$
- $\mathcal{P}(\mathcal{S}) = 1$
- $\mathcal{P}(\cup_{i=1}^{\infty} A_i) = \sum_{i=1}^{\infty} \mathcal{P}(A_i)$

#### Probability Equations

- $\mathcal{P}(A \cup B) = \mathcal{P}(A) + \mathcal{P}(B) - \mathcal{P}(A \cap B)$
- $\mathcal{P}(A|B) = \frac{\mathcal{P}(A \cap B)}{\mathcal{P}(B)} = \frac{\mathcal{P}(B|A)\mathcal{P}(A)}{\mathcal{P}(B)}$

Given  $\mathcal{S}$  and a family of subsets  $\mathcal{G} = \{\mathcal{A}_i, i \in I\}$  of  $\mathcal{S}$ , the  **$\sigma$ -field generated by  $\mathcal{G}$** , denoted  $\sigma(\mathcal{G})$ , is the smallest  $\sigma$  field containing all the subsets in  $\mathcal{G}$ .  
By “smallest”  $\sigma$ -field, we mean that for any  $\sigma$ -field  $\mathcal{F}_0$  containing all the sets in  $\mathcal{G}$ :

$$\sigma(\mathcal{G}) \subset \mathcal{F}_0$$

Given  $\mathbb{R}$ , the **Borel field of  $\mathbb{R}$**  is defined as the  $\sigma$ -field generated by the family of all open intervals

$$\mathcal{G} = \{(a, b) : \forall (a, b) \in \mathbb{R} \text{ such that } a < b\}.$$

We denote the Borel field of  $\mathbb{R}$  by  $\mathcal{B}(\mathbb{R})$ .

<b>pmfs</b> <b>uniform</b> $p(\omega) = \frac{1}{n}, \forall \omega \in \mathcal{S}$ <b>binomial</b> $p(k) = \binom{n}{k} a^k (1-a)^{n-k}$ <b>geometric</b> $p(k) = (1-a)a^k, a \in (0, 1)$ <b>poisson</b> $p(k) = \frac{\lambda^k e^{-k}}{k!}; k = 0, 1, 2, \dots; \lambda > 0$
--

#### Properties of the pdf:

- $f(r) \geq 0, \forall r \in \mathbb{R}$
- $\int_{-\infty}^{\infty} f(r)dr = 1$

Given a valid pdf, we can get a valid probability measure  $\mathcal{P}(\cdot)$ :

$$\mathcal{P}(A) = \int_A f(r)dr = \int_{-\infty}^{\infty} \cdot 1_A(r)dr$$

where

$$1_A(r) = \begin{cases} 1, r \in A \\ 0, r \notin A \end{cases}$$

is called the **indicator function** of the set A.

<b>pdfs</b> <b>uniform</b> $f(r) = \frac{1}{b-a} 1_{[a,b]}(r)$ <b>exponential</b> $f(r) = \lambda e^{-\lambda r} \cdot 1_{[0,\infty]}(r), \lambda > 0$ $\hookrightarrow = \begin{cases} \lambda e^{-\lambda r}, r \geq 0 \\ 0, r < 0 \end{cases}$ <b>gaussian</b> $f(r) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left(\frac{-(r-\mu)^2}{2\sigma^2}\right), r \in \mathbb{R}, \mu \in \mathbb{R}, \sigma > 0$
---

#### Conditional Probability

$$\mathcal{P}(A|B) = \frac{\mathcal{P}(A \cap B)}{\mathcal{P}(B)}$$

#### Bayes Formula

$$\mathcal{P}(A|B) = \frac{\mathcal{P}(B|A)\mathcal{P}(A)}{\mathcal{P}(B)}$$

#### Total Probability Law

$$\mathcal{P}(B) = \sum_{i=1}^n \mathcal{P}(B|A_i)\mathcal{P}(A_i)$$

#### Bayes Theorem

$$\mathcal{P}(A_m|B) = \frac{\mathcal{P}(B|A_m)\mathcal{P}(A_m)}{\sum_{i=1}^n \mathcal{P}(B|A_i)\mathcal{P}(A_i)}$$

Events  $A$  and  $B$  are **statistically independent** if and only if

$$\mathcal{P}(A \cap B) = \mathcal{P}(A)\mathcal{P}(B)$$

#### Bernoulli Trials

$$p_n(k) = \mathcal{P}(\mathcal{B}_k) = \binom{n}{k} p^k (1-p)^{n-k}$$

where  $p = \mathcal{P}_0(A)$ .

#### Properties of the cdf

$$F_{\mathbb{X}}(\alpha) = \mathcal{P}_x((-\infty, \alpha)) = \mathcal{P}(\{\mathbb{X} \leq \alpha\})$$

where

$$\{\mathbb{X} \leq \alpha\} = \{\omega \in \mathcal{S} : \mathbb{X}(\omega) \leq \alpha\} \in \mathcal{F}$$

Properties:

- $F_{\mathbb{X}}(\infty) = 1$  and  $F_{\mathbb{X}}(-\infty) = 0$
- If  $x_1 < x_2$ , then  $F_{\mathbb{X}}(x_1) \leq F_{\mathbb{X}}(x_2)$
- $\mathcal{P}(\{\mathbb{X} > \alpha\}) = 1 - F_{\mathbb{X}}(\alpha)$
- If  $x_1 < x_2$ , then  $\mathcal{P}(\{x_1 < \mathbb{X} \leq x_2\}) = F_{\mathbb{X}}(x_2) - F_{\mathbb{X}}(x_1)$
- $\mathcal{P}(\{\mathbb{X} = x_0\}) = F_{\mathbb{X}}(x_o) - F_{\mathbb{X}}(x_0^-)$  where  $F_{\mathbb{X}}(x_0^-) = \lim_{\epsilon \downarrow 0} F_{\mathbb{X}}(x_0 - \epsilon)$

#### Properties of the pdf

$$f_{\mathbb{X}}(x) = \frac{dF_{\mathbb{X}}(x)}{dx}$$

Properties:

- $f_{\mathbb{X}}(x) \geq 0, \forall x \in \mathbb{R}$
- $F_{\mathbb{X}}(x) = \int_{-\infty}^x f_{\mathbb{X}}(\alpha)d\alpha$
- $\int_{-\infty}^{\infty} f_{\mathbb{X}}(x)dx = F_{\mathbb{X}}(\infty) - F_{\mathbb{X}}(-\infty) = 1$
- $\mathcal{P}(\{x_1 < \mathbb{X} \leq x_2\}) = \int_{x_1}^{x_2} f_{\mathbb{X}}(x)dx = F_{\mathbb{X}}(x_2) - F_{\mathbb{X}}(x_1)$

<b>Dirac <math>\delta</math>-functions:</b> $\delta(x)$ <div> <ul style="list-style-type: none"> <li><math>\delta(x) = 0, \forall x \neq 0</math></li> <li><math>\int_{-\infty}^{\infty} \delta(x)dx = \int_{-\epsilon}^{\epsilon} \delta(x)dx = 1, \forall \epsilon &gt; 0</math></li> </ul> </div> <b>Sifting Property of Dirac <math>\delta</math>-functions</b> $\int_{-\infty}^{\infty} g(x)\delta(x-x_0)dx = g(x_0)$
--

#### Random Variable Forms

**gaussian**

$$f_{\mathbb{X}}(x) = \frac{1}{\sqrt{2\pi}\sigma} \exp[\frac{-(x-\mu)^2}{2\sigma^2}], \forall x \in \mathbb{R}$$

n.b.

$$F_{\mathbb{X}}(x) = \int_{-\infty}^x f_{\mathbb{X}}(\alpha)d\alpha = \Phi(\frac{x-\mu}{\sigma})$$

$$\text{where } \Phi(r) = \int_{-\infty}^r \frac{1}{\sqrt{2\pi}} e^{\frac{-z^2}{2}} dz$$

So if  $\mathbb{X}$  is a Gaussian RV with parameters  $\mu \in \mathbb{R}$  and  $\sigma > 0$ , then

$$\mathcal{P}(\{a < \mathbb{X} \leq b\}) = \Phi(\frac{b-\mu}{\sigma}) - \Phi(\frac{a-\mu}{\sigma})$$

#### uniform

$$\mathbb{X} = \text{u}[a, b], a < b$$

$$f_{\mathbb{X}}(x) = \frac{1}{b-a} \cdot 1_{[a,b]}(x)$$

$$F_{\mathbb{X}}(x) = \int_{-\infty}^x f_{\mathbb{X}}(\alpha)d\alpha$$

#### exponential

An RV  $\mathbb{X}$  with pdf of the form

$$f_{\mathbb{X}}(x) = \alpha e^{-\alpha x} \cdot 1_{[0,\infty]}(x)$$

where  $\alpha > 0$  is called an exponential RV with parameter  $\alpha$ .

#### binomial

Discrete RV taking on values in the set  $\{0, 1, 2, \dots, n\} \subset \mathbb{R}$  with pmf

$$\mathcal{P}_{\mathbb{X}}(k) = \binom{n}{k} p^k (1-p)^{n-k},$$

$$F_{\mathbb{X}}(x) = \sum_{k=0}^{m(x)} \binom{n}{k} p^k (1-p)^{n-k}$$

$$\text{where } m(x) \leq x < m(x) + 1,$$

$$f_{\mathbb{X}}(x) = \sum_{k=0}^n \binom{n}{k} p^k (1-p)^{n-k} \delta(x-k)$$

#### Conditional cdf and pdf

$$F_{\mathbb{X}}(x|M) = \mathcal{P}(\{\mathbb{X} \leq x\}|M) = \frac{\mathcal{P}(\{\mathbb{X} \leq x\} \cap M)}{\mathcal{P}(M)}$$

$$f_{\mathbb{X}}(x|M) = \frac{dF_{\mathbb{X}}(x|M)}{dx}$$

#### Total Probability Law

$$F_{\mathbb{X}}(x) = F_{\mathbb{X}}(x|A_1)P(A_1) + \dots + F_{\mathbb{X}}(x|A_n)P(A_n)$$

$$f_{\mathbb{X}}(x) = f_{\mathbb{X}}(x|A_1)P(A_1) + \dots + f_{\mathbb{X}}(x|A_n)P(A_n)$$

#### Bayes Formula

$$\mathcal{P}(A|\{\mathbb{X} \leq x\}) = \frac{F_{\mathbb{X}}(x|A)\mathcal{P}(A)}{F_{\mathbb{X}}(x)}$$

Now consider  $\mathcal{P}(A|B) = \frac{\mathcal{P}(B|A)\mathcal{P}(A)}{\mathcal{P}(B)}$  when  $B = \{x_1 < \mathbb{X} \leq x_2\}$ :

$$\begin{aligned} \mathcal{P}(A|\{x_1 < \mathbb{X} \leq x_2\}) &= \\ \hookrightarrow &= \frac{F_{\mathbb{X}}(x_2|A) - F_{\mathbb{X}}(x_1|A)\mathcal{P}(A)}{F_{\mathbb{X}}(x_2) - F_{\mathbb{X}}(x_1)} \end{aligned}$$

For  $\mathbb{X} = x$ ,

$$\begin{aligned} \mathcal{P}(A|\{\mathbb{X} = x\}) &= \frac{f_{\mathbb{X}}(x|A)}{f_{\mathbb{X}}(x)}\mathcal{P}(A) \\ \mathcal{P}(A) &= \int_{-\infty}^{\infty} \mathcal{P}(A|\{\mathbb{X} = x\})f_{\mathbb{X}}dx \end{aligned}$$

Bayes’ Theorem

$$f_{\mathbb{X}}(x|A) = \frac{\mathcal{P}(A|\{\mathbb{X} = x\})f_{\mathbb{X}}(x)}{\int_{-\infty}^{\infty} \mathcal{P}(A|\{\mathbb{X} = \alpha\})f_{\mathbb{X}}(\alpha)d\alpha}$$

Functions of RVs

For  $\mathbb{Y} = g(\mathbb{X})$  to be measurable,  $g(\cdot)$  must satisfy:

- 1. The domain of  $g(\cdot)$  must contain the range space of  $\mathbb{X}$ .
- 2. For each  $y \in \mathbb{R}$ , the set  $R_y = \{x \in \mathbb{R} : g(x) \leq y\}$  must be a Borel set.
- 3. The events  $\{g(\mathbb{X}) = \pm\infty\}$  must have probability 0.

Direct pdf Method

Suppose  $\mathbb{Y} = g(\mathbb{X})$ , where  $G : \mathbb{R} \rightarrow \mathbb{R}$  such that the inverse  $g^{-1}(\cdot)$  exists, and assume that

$$\frac{dx}{dy} = \frac{dg^{-1}(y)}{dy}$$

exists. Then

$$f_{\mathbb{Y}}(y) = f_{\mathbb{X}}(x(y)) \cdot \left| \frac{dx(y)}{dy} \right|$$

where  $x(y) = g^{-1}(y)$ .

Integration by parts

$$\int uv' du = uv - \int vu' du$$

The **mean** or **expected value** of a RV  $\mathbb{X}$  with pdf  $f_{\mathbb{X}}(x)$  is

$$E[\mathbb{X}] = \int_{-\infty}^{\infty} x f_{\mathbb{X}}(x) dx$$

The definition above applies to discrete RVs if we write their pdf using  $\delta$ -functions:

$$\begin{aligned} f_{\mathbb{X}}(x) &= \sum_k p_{\mathbb{X}}(x_k) \delta(x - x_k) = \sum_k p_k \delta(x - x_k) \\ E[\mathbb{X}] &= \sum_k x_k p_{\mathbb{X}}(x_k) \end{aligned}$$

If  $\mathbb{Y} = g(\mathbb{X})$  is a RV, then

$$E[\mathbb{Y}] = E[g(\mathbb{X})] = \int_{\infty}^{\infty} g(x) f_{\mathbb{X}}(x) dx.$$

Conditional mean of an RV

$$\begin{aligned} E[\mathbb{X}|M] &= \int_{-\infty}^{\infty} x f_{\mathbb{X}}(x|M) dx \text{ (continuous)} \\ E[\mathbb{X}|M] &= \sum_k x_k p_{\mathbb{X}}(x_k|M) \text{ (discrete)} \end{aligned}$$

Expected value of function  $g(\mathbb{X})$

$$E[g(\mathbb{X})] = \int_{-\infty}^{\infty} g(x) f_{\mathbb{X}}(x) dx = \sum_k g(x_k) p_{\mathbb{X}}(x_k)$$

Linearity of Expectation

Let  $g_1(\mathbb{X})$  and  $g_2(\mathbb{X})$  be two function of a RV  $\mathbb{X}$  and let  $\alpha$  and  $\beta$  be two constant ( $\alpha, \beta \in \mathbb{R}$ ). Then

$$E[\alpha g_1(\mathbb{X}) + \beta g_2(\mathbb{X})] = \alpha E[g_1(\mathbb{X})] + \beta E[g_2(\mathbb{X})]$$

Variance of RV  $\mathbb{X}$

$$\text{var}(\mathbb{X}) = E[(\mathbb{X} - \overline{\mathbb{X}})^2] = \int_{-\infty}^{\infty} (x - \overline{\mathbb{X}})^2 f_{\mathbb{X}}(x) dx$$

where  $\overline{\mathbb{X}} = E[\mathbb{X}]$ .  
The positive square root of the variance of  $\mathbb{X}$  is called the **standard deviation** of  $\mathbb{X}$ :

$$\text{StDev}(\mathbb{X}) = \sigma_x = \sqrt{\text{var}(\mathbb{X})}$$

n.b.:

$$\text{var}(\mathbb{X}) = E[(\mathbb{X} - \overline{\mathbb{X}})^2] = E[\mathbb{X}^2] - (E[\mathbb{X}])^2$$

Means and variances of RV types  
gaussian

$$\begin{aligned} E[\mathbb{X}] &= \mu \\ \text{var}(\mathbb{X}) &= \sigma^2 \end{aligned}$$
